DOC NO. RL-360-ETSCH-A REV. A RIPOSTE LABORATORIES

CONTENTS

▶ What it does	3
▶ Running it locally	4
▶ Deploying to Cloudflare	4
▶ Tests	5
▶ How contour tracing works	6
▶ Keyboard	7

Lay out images on a print sheet, set the bleed and margins, and generate cut lines for a vinyl cutter. Everything runs in the browser – images never leave the machine they were opened on.

Starts on **US Letter**. A4, Legal, Tabloid, A3/A5 and 12×12 / 12×24 cutting mats are one dropdown away, plus any custom size.

SEC.01

WHAT IT DOES

Sheet setup

- ▶ Page presets and custom sizes, portrait or landscape, in inches, mm, cm or points.
- ▶ Adjustable **sheet bleed** – the media grows beyond the trim so artwork can run off the edge.
- ▶ Adjustable **margins** (linked or per-side), drawn as a live-area guide.
- ▶ Machine profiles (generic, Cricut, Silhouette, Roland) seed sensible bleed, margin and registration-mark defaults.

Placing artwork

- ▶ Drop in PNG, JPEG, WebP, GIF or SVG – several at once, or paste from the clipboard.
- ▶ Move, scale from any corner or edge, rotate, and flip. Corners keep the aspect ratio; hold Shift to scale freely, Alt to scale from the centre.
- ▶ Snapping to the trim edge, the margins, the sheet centre and to other images, with guide lines. Hold Alt to bypass it.
- ▶ Align, distribute, auto-arrange, and "fill sheet with selection" for sticker sheets.
- ▶ Live checks: artwork off the sheet, cut lines crossing the margin, overlapping cut areas, and low effective DPI.

Cut lines

- ▶ **Contour** – traces the artwork's actual silhouette. Keys on transparency, or on a background colour sampled from the image for opaque files (JPEGs, scans).
- ▶ **Rectangle** – a box around the artwork, with an optional corner radius.
- ▶ Per-image **offset** (the sticker bleed), outward or inward, plus edge tolerance, corner smoothing, and a size threshold that ignores stray specks.
- ▶ Registration marks: crop marks, corner squares, Silhouette square-and-brackets, or the Cricut sensor border. The layout tools keep artwork clear of them.

Output

- ▶ Print file: PNG, JPEG or PDF at 150/300/600 DPI, with or without bleed and marks.
- ▶ Cut file: SVG at true size (1 unit = 1 mm) with paths on a layer named `CutContour`, either alongside the embedded artwork or on its own. DXF in millimetres for plotters and CAM.
- ▶ The PDF carries a `TrimBox` and vector cut paths in cut magenta.
- ▶ Projects save to a `.etsch.json` file, and the current sheet is restored automatically on your next visit (IndexedDB).

SEC.02

RUNNING IT LOCALLY

Needs **Node 22 or newer** (see `.nvmrc`); Node 20 reached end of life in April 2026. The app itself is plain ES modules, HTML and CSS with no build step – Node is only used for the dev server, the tests and deployment.

SH

```
nvm use          # or: fnm use
npm ci
npm run dev       # serves ./public at http://localhost:5173
```

SEC.03

DEPLOYING TO CLOUDFLARE

The site is static, so it deploys as a Cloudflare Worker with static assets.

SH

```
npx wrangler login    # one time, opens a browser
npx wrangler deploy    # -> https://etsch.<your-subdomain>.workers.dev
```

For CI or a headless machine, set `CLOUDFLARE_API_TOKEN` (Workers Scripts:Edit permission) and `CLOUDFLARE_ACCOUNT_ID` instead of logging in.

To serve it from your own domain, add a route in `wrangler.toml`:

TOML

```
| routes = [{ pattern = "etsch.example.com", custom_domain = true }]
```

`public/_headers` sets a strict Content-Security-Policy, `nosniff`, and a no-referrer policy. There is no server code and no analytics.

SEC.04

TESTS

SH

```
| npm test                # 84 checks
```

CI runs them on Node 22 and 24 on every push and pull request, along with a syntax check of every browser module and a credential-free `wrangler deploy --dry-run` to catch a broken Cloudflare config.

- ▶ `tests/logic.test.mjs` – unit parsing, page geometry, undo history, the tracing algorithms, marks, layout tools and the SVG/DXF writers. Runs on plain Node.
- ▶ `tests/canvas.test.mjs` – contour tracing against real artwork, sheet rasterisation and the PNG/JPEG/PDF writers, using `@napi-rs/canvas` in place of the browser's `OffscreenCanvas`. Skips if that dev dependency is missing.
- ▶ `tests/project.test.mjs` – the `.etsch.json` round trip: saving a sheet, reopening it, and doing so without a network request (the deployed `connect-src 'self'` refuses the `data:` URLs a project file is made of).
- ▶ `tests/dom.test.mjs` – boots `public/index.html` in `jsdom` and drives the panels, checking the seam between the markup and the document model. `jsdom` has no lay-

out engine and no canvas context, so it proves nothing about where anything is **drawn**; use the two below for that.

- ▶ `tests/preview.mjs` – renders a demo sheet to PNG so cut paths can be eyeballed: `node tests/preview.mjs docs`.
- ▶ `tests/browser-render.html` – open it through a local server to confirm the on-screen renderer works in a real browser.

SEC.05

HOW CONTOUR TRACING WORKS

`public/js/trace.js`, in order:

1. Draw the artwork into a padded working buffer sized so one pixel is square in millimetres.
2. Build a binary mask, keying on alpha or on the background colour sampled from the artwork's corners.
3. Drop blobs below the size threshold – done **before** offsetting, so a large offset cannot inflate a speck back into a cut path.
4. Grow (or shrink) the mask by the offset using an exact Euclidean distance transform.
5. Label the remaining blobs and walk each boundary with Moore-neighbour tracing.
6. Simplify each ring with Ramer-Douglas-Peucker, split at its farthest point so the ring is not measured against a zero-length baseline.
7. Convert to closed cubic béziers with Catmull-Rom smoothing.

The result is cached per image and per cut setting, and retraced lazily on idle.

SEC.06

KEYBOARD

I	Add images
Ctrl+S / E	Save project / Export
Ctrl+Z	Undo (Shift to redo)
Ctrl+D / A	Duplicate / select all
Delete	Remove selection
Arrows	Nudge (Shift for 10×)
Space+drag	Pan · Ctrl+wheel to zoom
Ctrl+0	Fit sheet to window
